

Website Handling Manual

Everything you need to run **shivaniherbal.com** yourself —
add customer reviews, change videos, and keep the site yours.

No technical knowledge needed. Every task is a few taps.

Prepared for the Shivani Herbal Beauty Parlour team · 2026

What's inside

- 1 · The three things you own
- 2 · One-time setup: your GitHub account
- 3 · Taking ownership of the website (transfer)
- 4 · The golden rule of editing
- 5 · Written reviews — add, change, remove
- 6 · Client videos — add, change, remove
- 7 · Things you must never touch
- 8 · If something looks wrong
- 9 · Quick reference card

How to read this manual: every task is written as numbered steps. Do them in order, exactly as written. Green boxes look like the real buttons you will see on screen.

1 · The three things you own

Your website is made of three pieces. Keep the logins for all three safe — they are the property of the parlour.

The website files	Stored on github.com in a folder called shivani-parlour . This is where you make every change.
The address	shivaniherbal.com , registered at godaddy.com . It renews every year — keep auto-renew ON and the payment card current, or the site goes offline.
This manual + a backup	Keep a copy of the website folder and this PDF in Google Drive or a pen drive.

2 · One-time setup: your GitHub account

GitHub is the website's control room. You need an account once; after that you just log in.

- 1** On any phone or computer, open **github.com/signup**.
- 2** Enter the parlour's email address, choose a password, and pick a username (for example **shivaniherbal**).
Write the username and password in a safe place.
- 3** Complete the email verification code GitHub sends you. Done — you have an account.

3 · Taking ownership of the website

Right now the website lives in the account **Kaushik-Sarda**. Moving it to your account is a one-time, two-person step:

Kaushik does this (5 minutes):

- 1 Log in to github.com → open the **shivani-parlour** repository → click **Settings**.
- 2 Scroll to the bottom (“Danger Zone”) → click **Transfer ownership**.
- 3 Type the parlour's new GitHub username, confirm, and send the transfer.

You do this:

- 4 Open the email GitHub sends you and click **Accept transfer**. The website is now yours.
- 5 One small follow-up: in GoDaddy → your domain → DNS, edit the record of type **CNAME** with name **www** and change its value to **YOUR-USERNAME.github.io** (your new GitHub username).
*Also check github.com → your **shivani-parlour** repository → Settings → Pages still shows Custom domain: **shivaniherbal.com**. Re-enter it there if empty.*
- 6 For the domain: either Kaushik shares the GoDaddy login with you, or (cleaner) GoDaddy → Domain → “Transfer to another GoDaddy account” moves it to your own GoDaddy account.

After the transfer, the site keeps running at shivaniherbal.com without interruption.

4 · The golden rule of editing

Every change — reviews or videos — follows the same simple pattern:

- 1 Log in at **github.com** and open your **shivani-parlour** repository.
- 2 Click the file you want to change, then click the **pencil icon** (top-right of the file view) to edit.
- 3 Make your change, then press the green button:

Commit changes

- 4 A small box appears — press the green **Commit changes** button again.
- 5 Wait 1–2 minutes, then open **shivaniherbal.com** and refresh. Your change is live.
On a phone: pull down on the page to refresh. If you don't see the change, wait 5 minutes and refresh again.

5 • Written reviews — add, change, remove

All written testimonials live in one small file called **reviews.json**. The website reads this file and draws one review card for every entry.

One review looks like this:

```
{
  "stars": 5,
  "quote": "The best facial I have ever had!",
  "name": "Anita",
  "source": "Google Review"
},
```

To ADD a review:

- 1 Open **reviews.json** in your repository and click the pencil icon.
- 2 Copy an existing review block — from its opening **{** to its closing **}**, — and paste it below the last one (but before the final **})**.
- 3 Change the stars (1–5), the quote, the name, and the source to the new review.
- 4 Check the commas: every review block ends with **}**, except the very last one, which ends with **}** only.
This comma rule is the only thing that can go wrong — check it twice.
- 5 Press **Commit changes** (twice, as always). Refresh the site after 2 minutes.

To CHANGE a review: edit the words between the quotation marks and commit.

To REMOVE a review: delete its whole block from **{** to **}** (including the comma after it, if any) and commit.

Only use quotation marks like " straight quotes " inside the file — avoid the curly quotes some phone keyboards insert. If the reviews vanish from the site, a comma or quote is wrong — re-open the file and compare with the example above.

6 · Client videos — add, change, remove

Videos appear in the “Hear it from our clients” strip. They are controlled by two things: the video files (in the folder **assets/videos**) and the list file **videos.json**.

Step A — prepare the video

- 1 Use an MP4 video (WhatsApp videos already are). Keep it under about 25 MB — if it's bigger, WhatsApp it to yourself once; WhatsApp compresses it.
- 2 Give the file a simple name with no spaces, e.g. **bridal-story.mp4**.

Step B — upload it

- 3 In your repository, click the **assets** folder, then the **videos** folder.
- 4 Click **Add file** → **Upload files** (top right), choose your video, then press:

Commit changes

Step C — put it on the page

- 5 Open **videos.json** (it's in the main folder) and click the pencil icon.
- 6 Copy the existing block and paste it below, then change it to your new file:

```
{
  "video": "assets/videos/bridal-story.mp4",
  "caption": "Bridal Transformation"
},
```

- 7 Same comma rule as reviews: every block ends **}**, except the last one (**}**). Commit, wait 2 minutes, refresh the site.
The "poster" line seen on the first video is optional — without it the video simply shows its first frame.

To REMOVE a video: delete its block from **videos.json** and commit. (You can also delete the file itself in **assets/videos** → open the file → trash-can icon.)

To REPLACE the main video: upload the new file, then edit the first block in **videos.json** to point to it.

Add as many videos as you like — the strip scrolls sideways automatically and arrows appear when there are more videos than fit on screen.

7 • Things you must never touch

Do not edit or delete these — the site breaks or goes offline:

- The file called **CNAME** (connects shivaniherbal.com to the site)
- The files **index.html**, **styles.css**, **script.js** (the site itself)
- The **DNS records in GoDaddy** (the four “A” records and the “www” record)
- The **assets folder's logo and image files** (unless replacing intentionally)

If a bigger change is ever needed (new sections, prices, design), ask any web developer — the site is standard HTML/CSS and the README file in the repository explains everything.

8 • If something looks wrong

My change is not showing	Wait 5 minutes, then refresh the page (pull down on phone, Ctrl+Shift+R on computer).
All reviews/videos disappeared	A comma or quotation mark in the .json file is wrong. Open the file, compare with the examples in sections 5–6, fix, commit again.
A video won't play	Check the file name in videos.json matches the uploaded file exactly (including .mp4), and that the video is a normal MP4 under ~25 MB.
The whole site is down	Almost always the domain renewal — log in to GoDaddy and check the domain is active and paid. The backup address always works: YOUR-USERNAME.github.io/shivani-parlour

9 • Quick reference card

I want to...	Open this file	Then
Add / edit / remove a written review	reviews.json	Edit → Commit changes
Add a client video	assets/videos + videos.json	Upload file → add block → Commit
Remove a video	videos.json	Delete its block → Commit
See the live site	shivaniherbal.com	Refresh after ~2 minutes
Site emergency	godaddy.com	Check domain is active/paid

Brings to life the beautiful person in you.
